

At first glance, there appears to be no gender gap in AI use...

Share of employed adults who have used AI for a work task

Women

Men

Bars show 90% confidence intervals. The two overlap: the difference is within the survey’s margin of error.

Source: U.S. Census Bureau, Household Trends and Outlook Pulse Survey, March 2026.
Weighted; n = 6,573 employed adults.

The gender gap opens when you ask how often AI is used

The same workers, counted three ways

Women Men

Have used AI for a work task

gap, in points

Used AI at work last week

Used AI at work every day last week

Source: U.S. Census Bureau, Household Trends and Outlook Pulse Survey, March 2026.
Weighted; n = 6,573 employed adults (6,550 for the frequency measures).

Women hold more jobs in 'High AI' occupations

Women hold more jobs in occupations where most workers use AI — education, admin, and (at almost exactly half) healthcare. Men hold more of the construction, production and transport jobs, where AI use is very low. That alone should mean women use AI about 5 points more often than men. Something is going on inside the jobs.

Source: U.S. Census Bureau, Household Trends and Outlook Pulse Survey, March 2026.
Weighted. Occupations ordered by the share of workers who have used AI. Farming, fishing and forestry omitted (1% of workers).

The gender gap is based on four technical tasks

Share of workers who use AI at work and report using it for this task

Source: U.S. Census Bureau, Household Trends and Outlook Pulse Survey, March 2026.
Weighted; n = 4,091 workers who have used AI for at least one work task.
